Acadia Centre for Estuarine Research

Tidal Energy & Marine Life: Pro-testing Not Protesting

The macro-tidal waters of the Bay of Fundy have been the focus of tidal energy development proposals for more than 100 years.

Recent developments of in-stream turbine designs offer alternative solutions to barrage-style tidal power operations. But can marine life co-exist with the new technology? What will be the effects of small to large developments?

This talk will address a number of approaches to examine risk to fish and marine mammals at Canada's leading tidal power test facility.
